1. Getting started

The device is meant to be used with a stylus on a small resistive screen. Controls are dense but precise, the bars stay visible, and one program fills the space between them. 3. Starting programs

Tap Start in the top left corner, then a program. Type a few letters with the on-screen keyboard to search. The device is meant to be used with a stylus on a small resistive screen. 4. Switching programs

The Windows button in the command bar lists running programs, most recently used first. The device is meant to be used with a stylus on a small resistive screen. Controls are dense but precise, the bars stay visible, and one program fills the space between them.

5. Entering text

The keyboard button at the bottom right shows the on-screen keyboard. Applications shrink so the keyboard never covers them. The device is meant to be used with a stylus on a small resistive screen. 6. Long press

Hold the stylus still for about half a second to get a context menu, like a right click. The device is meant to be used with a stylus on a small resistive screen. Controls are dense but precise, the bars stay visible, and one program fills the space between them.

7. Saving and closing

Programs keep their own Save commands. Close in the command bar asks the program to close normally, so it can offer to save unsaved work. 8. Ending the session

End session in the Start menu closes every program the same way and only ends when all of them have closed. The device is meant to be used with a stylus on a small resistive screen. Controls are dense but precise, the bars stay visible, and one program fills the space between them.
